

PHASE 6: PROJECT TESTING PHASE

1. System Engineering Testing Strategies [1]The testing matrix for ComicCraft executes comprehensive end-to-end integration verification loops. Unit validation logs confirm form body extraction rules, load tests process long unstructured natural text paragraphs, and failure resistance structures confirm that server channels catch model exception errors gracefully before causing terminal crashes.

2.. Comprehensive Quality Engineering Validation Logs [1]

Unit Validation Log 1: Routing Architecture Check [1]

Test Objective: Ensure that web routing gateways process GET requests directed to the root endpoint locator without returning 404 connection anomalies.

Input Parameters Matrix: Network HTTP GET connection call dispatched straight to sub-root location \.Observed System Outcome: Serves the exact compiled homepage HTML interface containing form fields, returning an HTTP status response code of 200 safely.

Functional Validation Status: 100% PASSED.Unit Validation Log 2: Dynamic Token Ingestion Edge Tests [1]Test Objective: Evaluate boundary token handling when feeding highly descriptive, unformatted narrative plot scripts into language model structures.

Input Parameters Matrix: Unstructured plot parameter: "A brave fox named Leo discovering glowing neon mushroom pathways inside magical forests." [1]

Observed System Outcome: Google Gemini Flash returns an uncorrupted 5-panel layout matrix dictionary containing explicit panel sequence markers, banners, and tailored illustration vectors.

Functional Validation Status: 100% PASSED.

Unit Validation Log 3: High-Throughput Graphics Farm Verification [1]

Test Objective: Verify that passing variable visual keywords to diffusion modules downloads visual assets cleanly onto solid-state local storage.

Input Parameters Matrix: Art style prompt variables sent straight to developers utility endpoints /test-image.Observed System Outcome: Downloads and caches crisp 512x512 resolution panel JPEG graphic illustrations inside designated static storage slots cleanly.

Functional Validation Status: 100% PASSED

.Unit Validation Log 4: FPDF Document Compiler Canvas Spacing Test [1]

Test Objective: Verify that passing populated asset dictionary structures into compilation methods prints clean multi-page documents without alignment errors.

Input Parameters Matrix: Multi-panel data maps injected directly into save_pdf() execution hooks.

Observed System Outcome: Compiles a non-corrupted, print-ready vector PDF document file across separate pages, maintaining perfect image-to-text margin spacing. Functional Validation Status: 100% PASSED.
